

Job Posting: 465984 - Position: AI Software Developer

Co-op Work Term Posted:	2026 - Fall
App Deadline	05/19/2026 09:00 AM
Application Method:	WaterlooWorks
Posting Goes Live:	05/09/2026 09:00 AM
Job Posting Status:	Approved

Company Information

Organization	Marsh And McLennan Companies Inc
Division	Financial Infrastructure Solution

Job Posting Information

Work Term	2026 - Fall
Job Type	Co-op Main
Job Title	AI Software Developer
Number of Job Openings	3
Level	Junior Intermediate Senior
Region	ON - Toronto
Job - Address Line One	120 Bremner Blvd
Job - City	Toronto
Job - Province/State	Ontario
Job - Postal/Zip Code	M5J 3A8
Job - Country	Canada
Employment Location Arrangement	Hybrid

Additional Employment Arrangement Location Information

Hybrid 3 days in office

Work Term Duration	4 month work term
---------------------------	-------------------

Job Summary

Join our team building agentic development tools that help developers design, run, and scale autonomous AI workflows. This co-op is a hands-on software engineering and architecture role for students with strong software fundamentals and a curiosity for large language models, agent architectures, and orchestration systems. You will ship prototypes, production-ready components, and research-grade experiments that empower developer productivity and trust in agentic systems.

Why This Role is Exciting

Impact: Work on foundational tooling that shapes how developers build and operate autonomous AI workflows across the organization.

Mentorship: Pair directly with senior engineers and architects; weekly demo days and technical reviews to accelerate learning. Real ownership: Ship features from prototype to production in a supportive environment.

Innovation: Experiment with bleeding-edge agent techniques and contribute to evaluations that guide future product direction.

Job Responsibilities

What You'll Do

- Implement and iterate on core components of agentic toolchains: agent orchestration, tool interfaces, memory and context management, and multi-step reasoning pipelines.
- Build integrations with LLM APIs, knowledge stores, and external tools (APIs, databases, web services) to enable safe, reliable agent behavior.
- Prototype new agent strategies and evaluate their performance and safety.
- Design and develop developer-facing SDKs, CLIs, and web-based debugging/observability tools to speed adoption and troubleshooting.
- Write robust, well-tested code; contribute to SecDevOps, containerization, and deployment practices for reproducible experiments and services.
- Collaborate closely with product, architecture, and security teams to balance innovation with safety, auditability, and privacy.
- Document designs, runbooks, and demo examples so other engineers and students can reuse your work.

Required Skills

What You'll Learn and Deliver

- Hands-on experience building agentic systems that combine LLMs, external tools, and orchestration layers.
- Practical engineering skills: APIs, SDKs, containers, unit and integration testing, monitoring, and deployment pipelines.
- Exposure to LLM evaluation techniques, OWASP Top 10 LLM, safety mitigations, and performance trade-offs for multi-step agents.
- Deliverables may include working prototypes, a public/internal demo, SDK examples, evaluation reports, and merged production components.

Must-Have Qualifications

- Strong programming skills in experience with TypeScript/JavaScript, Python.
- Familiarity with REST APIs, WebSockets, or RPC-style integrations and experience working with JSON-based APIs.
- Comfortable with Git-based workflows and writing unit/integration tests.
- Demonstrated interest in AI/ML and large language models (coursework, projects, or internships). Examples of projects you've built that use LLMs, prompt engineering, or tool-using agents are highly valued.
- Good communication skills and the ability to work in cross-functional teams.

Nice-to-Have

- Experience with one or more ML/LLM frameworks or toolkits (Hugging Face Transformers, Mastra, LangChain, LlamaIndex, etc.).
- Familiarity with agentic patterns (planner-executor, tree-of-thoughts, ReAct, Auto-GPT style orchestration).
- Cloud experience with AWS, Mongo, and Kubernetes.
- Experience with observability tools (Datadog) or A/B/eval frameworks.
- Understanding of safety, privacy, or secure-by-design engineering practices for AI systems.

Compensation and Benefits

Compensation CAD \$35/hour

WaterlooWorks

Additional Application Information

How to Apply

Please submit your resume, a short cover note describing a relevant AI/LLM project you've worked on, and an up-to-date transcript. Include links to code samples, GitHub repositories, or demos if available.
